

8 extends in a direction at least substantially normal
9 to said predetermined axis; and
10 a second section remote from said first section
11 and including at least one at least substantially
12 straight elongated cutting edge at least substantially
13 normal to said direction and arranged to make in a
14 workpiece a cut having a width which is a function of
15 the extent of oscillatory movement of said output shaft,
16 of the distance from said axis to said cutting edge and
17 of the length of said cutting edge.--.

Please replace the claim 12 (ONCE AMENDED) with
the following new claim:

1 --21. (REPLACES THE ONCE AMENDED CLAIM 12) A tool
2 for removal of material from workpieces with a manually
3 operable apparatus having a power driven output shaft
4 arranged to oscillate about a predetermined axis, com-
5 prising:
6 an elongated member having a first section arrang-
7 ed to be mounted on said output shaft so that the member
8 extends in a direction at least substantially normal
9 to said predetermined axis;
10 a second section remote from said first section
11 and including at least one at least substantially
12 straight cutting edge at least substantially normal to
13 said direction; and

14 means for facilitating removal of material from
15 a workpiece being cut by said cutting edge.--.

Please replace the claim 13 with the following
claim:

1 --13. (AMENDED) The tool of claim 21, wherein
2 said removal facilitating means comprises at least one
3 slot provided in said elongated member and extending
4 between said first and second sections.--.

Please replace the claim 14 with the following
claim:

5-4 --14. (AMENDED) The tool of claim 21, wherein
said at least one cutting edge has first and second ends
and said removal facilitating means comprises recessed
portions at said ends of said at least one cutting edge
intermediate said first and second sections.--.
